

Practice_set_01

Python notes by wahab

Problems

1. Write a simple Python script that prints out a few lines of text. Add comments to describe what the script does and what each print statement is for.
2. Create a module named greetings.py that contains a single string variable message with a greeting text. In another script, import this module and print the value of message.
3. Install a package using pip and then write a script that checks if the package is installed by running pip list and viewing the output.
4. Write a script that prints out your favorite color and your favorite number. Use comments to describe each line of code.
5. write a python program to use any built in module.
